bangladesh is extremely vulnerable to the impact of climate change because it is a low lying flat country subject to both riverine flooding and sea level rise and because a large portion of its population is dependent on agriculture for its livelihood the goal of this research was to examine the likely impacts of climate change on agriculture in bangladesh and develop recommendations to policymakers to help farmers adapt to the changes in this study we use climate data from four general circulation models gcms to evaluate the impact of climate change on agriculture in bangladesh by 2050 we use the dssat decision support system for agrotechnology transfer crop modeling software to evaluate crop yields first for the 1950 to 2000 period actual climate and then for the climates given by the four gcms for 2050 we evaluate crop yields at 1 789 different points in bangladesh using a grid composed of roughly 10 kilometer km squares for 8 different crops in 2000 and 2050 for each crop we search for the best cultivar variety at each square rather than limiting our analysis to a single variety for all locations we also search for the best planting month in each square in addition we explore potential gains in changing fertilizer levels and in using irrigation to compensate for rainfall changes this analysis indicates that when practiced together using cultivars better suited for climate change and adjusting planting dates can lessen the impacts of climate change on yields especially for rice and in some cases actually result in higher yields in addition the analysis shows that losses in yield due to climate change can be compensated for for many crops by increasing the availability of nitrogen in the soil moreover we used a household survey to collect information on the incidence of climatic shocks in the last five years and adaptation options the survey was conducted from december 2010 to february 2011 covering data from the previous production year the results confirm that bangladesh farmers already perceive the impacts of climate change in particular the survey results indicate

that of all climate change related shocks floods waterlogging and river erosion caused the largest loss to rice production farmers in our survey lost around 12 percent of their harvest on average to some kind of shock with about half of that attributable to flooding related issues the second leading cause of rice crop loss was pests responsible for around 3 percent of production taken together the results indicate that adaptation efforts in bangladesh should include adjusting planting dates using improved cultivars better suited for climate change improving fertilizer application exploring increased maize production and bolstering flood and pest protection for farmers
