the ultimate practical resource for today s rf system design professionals radio frequency components and circuits form the backbone of today s mobile and satellite communications networks consequently both practicing and aspiring industry professionals need to be able to solve ever more complex problems of rf design blending theoretical rigor with a wealth of

practical expertise practical rf system design addresses a variety of complex real world problems that system engineers are likely to encounter in today s burgeoning communications industry with solutions that are not easily available in the existing literature the author an expert in the field of rf module and system design provides powerful techniques for analyzing real rf systems with emphasis on some that are currently not well understood combining theoretical results and models with examples he challenges readers to address such practical issues as how standing wave ratio affects system gain how noise on a local oscillator will affect receiver noise figure and desensitization how to determine the dynamic range of a cascade from module specifications how phase noise affects system performance and where it comes from how intermodulation products im3s predictably change with signal amplitude and why they sometimes change differently an essential resource for today s rf system engineers the text covers important topics in the areas of system noise and nonlinearity frequency conversion and phase noise along with a wealth of practical examples using matlab r and excel spreadsheets are available for download from an ftp site to help readers apply the methods outlined in this important resource

more recently khovanov introduced link homology as a generalization of the jones polynomial to homology of chain complexes and ozsvath and szabo developed heegaard floor homology that lifts the alexander polynomial these two significantly different theories are closely related and the dependencies are the object of intensive study these ideas mark the beginning of a new era in knot theory that includes relationships with four dimensional problems and the creation of new forms of algebraic topology relevant to knot theory the theory of skein modules is an older development also having its roots in jones discovery another significant and related development is the theory of virtual knots originated independently by kauffman and by goussarov polyak and viro in the 90s all these topics and their relationships are the subject of the survey papers in this book
